The present article highlights the pharmaceutical and physiological effect of purified β-glucan from an edible mushroom (Pleuratus florida) as an immunomodulator on the innate immune responses in broiler. Also, mushroom glucan as a feed supplement significantly provides protection against disease. This article portrays the potentiality of β-glucan (mushroom origin) as an immunostimulant in poultry.

Key words: Fungus, Chicken, Immunomodulator, Yeast.

INTRODUCTION
Immunomodulator stimulates leucocytes, particularly cells of the macrophage system and modulates and potentiates the immune system of the body (Wadstrom, 1990). It has been recommended earlier that the constant addition of immunomodulators to feed is beneficial for prevention of diseases (Onarheim, 1992). One of such immunostimulant compound is β-Glucan, polymers of glucose which consists of a linear backbone of β-1, 3 linked D-glucopyranosyl residues having varying degree of branching from the C6 position (Bohn and BeMiller, 1995). β-Glucans are major structural components of yeast, mushrooms and fungal mycelia. Supplementation of β-glucan in diets increase the macrophage phagocytic activity, PHA-P-mediated lymphoproliferative response and also humoral response (Guo et al 2003). β-Glucan provides significant protection against pathogen as a feed additive by upregulating phagocytosis, bacterial killing, and oxidative burst in chicken (Lowry et al 2005).

In the mammalian system, action of β-glucan is mediated through toll-like receptors (TLR) and dectin-1 (Lowry et al 2005). In the present work, evaluation was carried out for short term dietary influence of a purified β-glucan, prepared from an edible mushroom, on innate immunity and disease resistance of broiler birds (Figure 1).
